

Energy and Climate Change Scenarios from a European Perspective

**Antonio Soria
Institute for Prospective Technological Studies (IPTS)
European Commission**

SESSA Conference: Investment for Sustainability

Madrid, April 19-20 2005

Outline

- **What is the problem?**
- **What have we done so far?**
- **Where do we go next: post-2012 Communication**
- **Model-based analysis**

What is the problem?

What is the source of the problem?

Greenhouse gas concentration

- Concentration of CO₂ has increased by 95 ppm (34%) to 375 ppm (global + Europe)
- All greenhouse gases rose by 170 ppm CO₂-equivalent (61% CO₂, 19% methane, 13% CFCs and HCFCs, and 6% N₂O)

past trends

Rise of greenhouse gases (1900–2000) compared to the year 1750

- Increase to 650 - 1215 ppm CO₂-equivalent is projected by 2100

future projection

Data-sources: IPCC

By 2100: global temperature will rise by 1.4 – 5.8 ° C and 2 – 6.3 ° C in Europe (EEA, 2004)

FIGURE 9.2
SPM - 10b

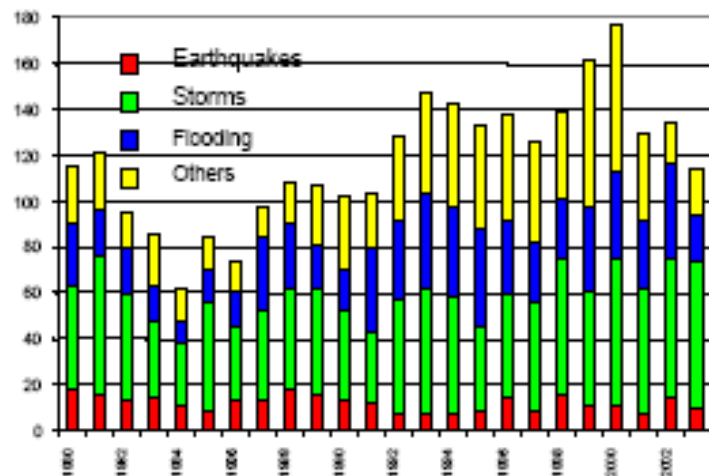

Extreme climate events lead to economic losses

- 64% of all catastrophic events and 79 % of economic losses since 1980 attributable to weather and climate extremes
- Doubling of annual disastrous weather climate related events over 1990s
- Economic losses increased from decadal average less than 5 in the 1980s to about more than 11 billion US\$ in 1990s)

past trends

- Increasing likelihood of extreme events \Rightarrow higher losses

future projection

What have we done so far?

European Climate Change Programme (ECCP): main elements

- **Objective: Identify and develop cost effective elements of EC strategy to meet its -8% Kyoto objective**
- **Major Milestones**
 - launch March 2000
 - October 2001: Commission Comm. on ECCP Action Plan
 - May 2003: second progress report
- **Total reduction potential of 578 - 696 Mt CO₂eq./year = twice Kyoto ‘-8%’ identified**
- **EU measures for 276 -316 Mt CO₂eq./year currently “in implementation”**

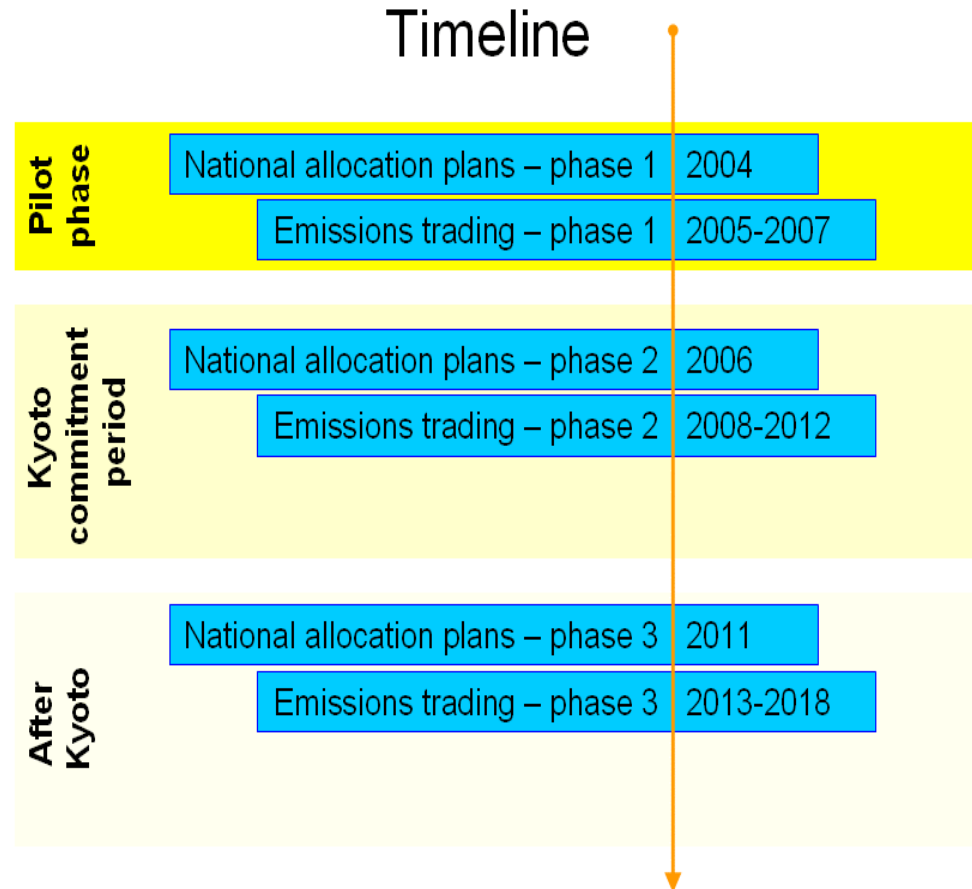

ECCP: Most important EU legislation in implementation relating to climate change

Policies and Measures	Reduction potential (Mt CO ₂ -eq.)	Entry into force	Starting to deliver
EU emission trading scheme	-	2003	2005
Link JI/CDM to emission trading	-	2004	2005/ 2008
Revision of the Monitoring Decision	-	2004	-
Directive on the promotion of CHP	65	2004	2006
Directive on energy performance of buildings	35-45	2003	2006
Directive on the promotion of transport bio-fuels	35-40	2003	2005
Directive on the promotion of electricity from renewable energy sources	100-125	2001	2003
Landfill directive	41	1999	2000
ACEA voluntary agreement	75-80	1998	1999
Energy labelling directives	20	1992	1993

EU emissions trading scheme (EU ETS)

- a new, market based instrument to reduce emissions
- reduces compliance costs for the EU industry
- US: successful emissions trading for other pollutants
- the largest scheme ever implemented
- Community-wide recognition of & trade in allowances

EU ETS - how it works

- **CO₂ emissions must be covered by allowances**
- **Community-wide trading of allowances**
- ***open*: might be linked to other schemes in the future**
- ***results-oriented*: companies decide how to reduce**
- ***scarcity* determined by total allocation across the EU**

Where do we go next?

The post-2012 Communication

The international state of play

- **Kyoto Protocol entered into force 16 February 2005, after it was ratified by the Russian Federation**
- **while the Bush administration has rejected the Protocol...**
- **Australia refuses ratify...**
- **the UNFCCC remains as the basis.**

- **Build on the Kyoto architecture**
 - **targets, timetables, market mechanisms, monitoring, compliance**
- **And let the architecture of the multilateral regime evolve further.**

Post-2012: Why must the EU further develop its climate strategy?

- **The Kyoto Protocol requires negotiations on the post-2012 regime to start in 2005**
- **European Spring Council 2005 wants to “consider mid and longer term strategies, including targets”**
- **Council has repeatedly operationalised this objective as no more than 2°C temperature increase**
- **Deep structural change requires a secure planning horizon to allow a smoother transition process for both the public and the private sector**

- **European Spring Council 2005: Commission invited to “prepare a cost benefit analysis which takes account both of environmental and competitiveness considerations”**
- **Commission launched a web-based stakeholder consultation**
- **The Commission’s Communication on action on climate change post 2012 (9 February 2005)**

“Action on climate change post-2102”
(http://europa.eu.int/comm/environment/climat/future_action.htm)

The Risk to overshoot 2°C

Mean climate sensitivity PDF
Note: Climate sensitivity probability density function averaged over 9 published estimates since 2001.
Only uncertainties in climate sensitivity considered. Other climate parameters are default settings consistent with IPCC Third Assessment Report.
Simple climate model used: MAGICC 4.1 (Wigley, Raper et al.) Historical temperature data and uncertainties according to Folland et al. (2001)

The 2°C challenge and cut in global emissions

Source: GCNRS/LEPII-EPE/RIVM/MNP/ICCS-NTUA/CES-KUL study

- By 2025, global reductions of 15 to 30 % from baseline are required, respectively in S650e and S550e
- By 2050, these reductions reach 35 to 65 %

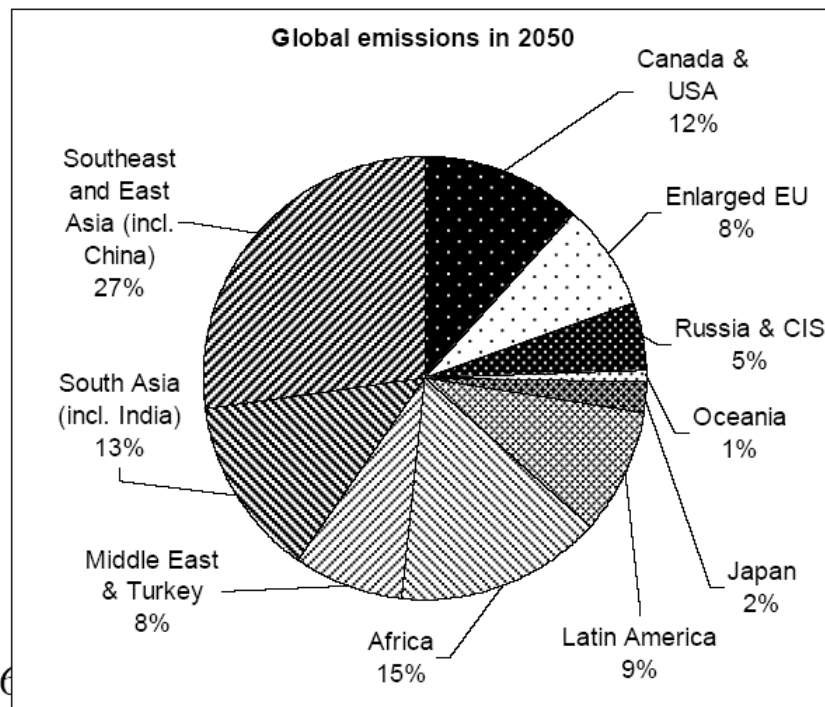

The Participation Challenge

2000

2050

The Innovation and Adaptation Challenges

- **The Innovation Challenge**
 - Pulling technological change: price signals
 - Pushing technological change: RTD
 - Technology innovation and the EU competitive edge in a ‘low carbon future’
 - **The Adaptation Challenge**
 - Further research to predict the impacts and adapt
 - Early prediction of more frequent and damaging natural disasters
-

Model-based analysis

The Institute for Prospective Technological Studies (IPTS)

- **The IPTS, based in Sevilla, is one of the 7 scientific institutes of the European Commission's Joint Research Centre (JRC)**
- **Its mission is to provide customer-driven support to the EU policy-making process by researching science-based responses to policy challenges that have both a socio-economic and a scientific or technological dimension**

Energy Modeling Activities at IPTS

Sustainability in Industry, Energy and Transport (SIET) Unit

○ Energy and Climate Change Group (<http://energy.jrc.es>)

- POLES Model: partial equilibrium model of the energy system
 - ◆ Power generation sector
 - ◆ Energy-intensive sectors individually modeled (steel, cement, refineries, pulp & paper, transport)
- GEM-E3 Model: general equilibrium model

POLES Model Development

- **Initially funded under the JOULE II programme of EU-DG Research**
 - **Main contribution from the CNRS-IEPE, ECOSIM, JRC-IPTS and the support of Enerdata, CEPPI, ETSU, FhG-ISI and other partners.**
 - **Complementarity with other E3 models: PRIMES and GEM-E3**
 - **1993-1995, a first version**
 - **Related research projects (e.g. TEEM, Technology Endogenisation in Energy Models)**
 - **Related *application* projects: WETO 2030 (World Energy, Technology, and climate policy Outlook), ACROPOLIS**
-

The POLES Model

A world simulation model for the analysis of energy systems and their global environmental impacts to 2010 and 2030 :

- **scenarios and projections for energy demand, supply and prices**
- **analysis of CO₂ emission reduction options in an international perspective**
- **impacts of technological change and R&D strategies**

POLES Characteristics

- **The POLES model is a *recursive simulation* model at world level, working on a year by year basis, from 1998 to 2030**
 - **It incorporates more than 60,000 variables**
 - **Main exogenous variables are GDP and population. Energy prices are endogenous**
 - **It is built of a system of >50,000 equations organised in *modules* for the different countries/regions and energy consuming sectors, activities and technologies**
-

POLES Characteristics

- **Interconnected modules: international energy markets, national energy demand, new technologies, electricity production, primary energy production and CO₂ emissions, energy-intensive sectors**
 - **Outcomes**
 - Regularly updated Reference Case
 - World long-term energy scenarios or projections (*WETO*)
 - National-regional energy balance and CO₂ emissions simulation
 - Analysis of new energy technologies potentials, markets and diffusion
 - Test of energy policies and energy RTD strategies
-

Technology Rich / Bottom-up Model: Electricity generation technologies

☞ Conventional large size hydropower	HYD
☞ Nuclear Light Water Reactor	LWR
☞ New nuclear design	NND
☞ Supercritical pulverised fuel combustion (coal)	PFC
☞ Integrated coal gasification with CC	ICG
☞ Advanced thermodynamic cycle (coal)	ATC
☞ Lignite powered conventional thermal	LCT
☞ Coal powered conventional thermal	CCT
☞ Oil powered conventional thermal	OCT
☞ Gas powered conventional thermal	GCT
☞ Gas powered gas turbine in combined cycle	GGT
☞ Oil powered gas turbine in combined cycle	OGT

Techno-economic Characterisation of Technologies

For each technology and country, and time period:

- Costs (fixed –investment-, variable)
- Installed capacity
- Efficiency
- Emission factors
- Life time of plants
- Construction time

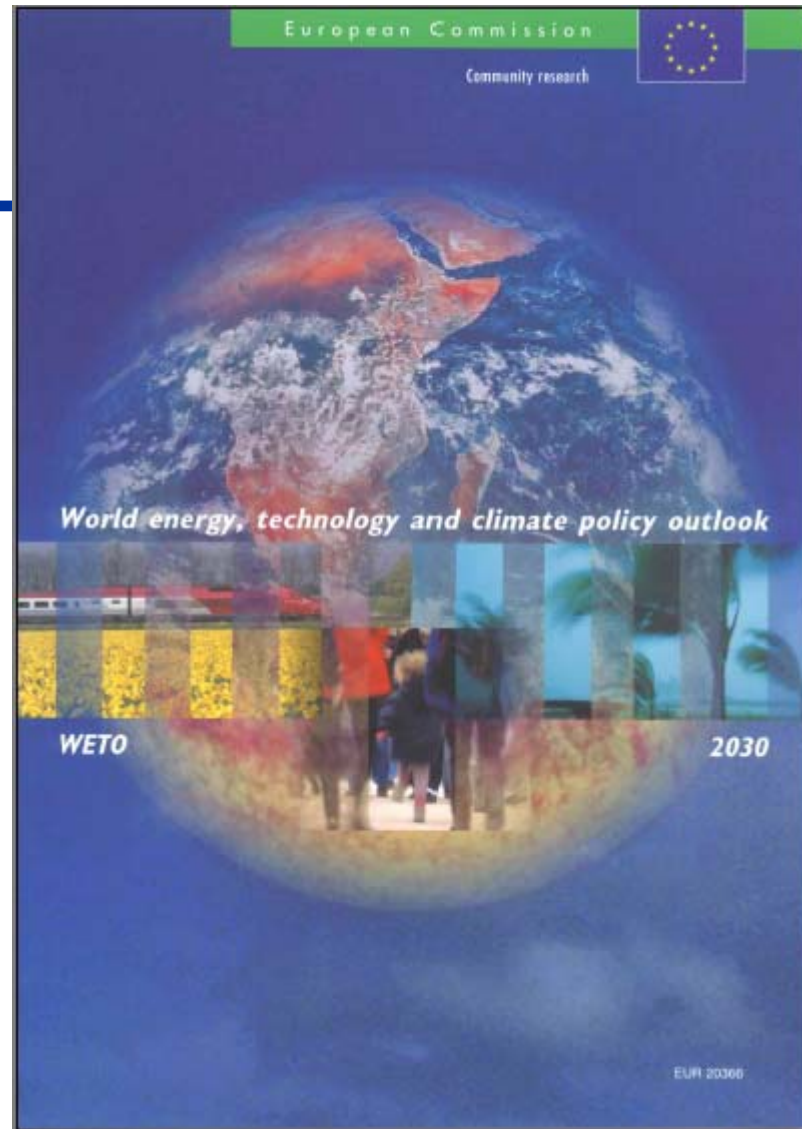

WETO 2030

**World Energy, Technology and
climate policy Outlook**

EUR/20366/EN

<http://energy.jrc.es/>

Energy-related CO₂ Emissions

World Oil Production

World Gas Production

World Power Generation

Impact of Alternative Technology Cases

- ❖ **Defined as technological breakthroughs affecting alternative sectors (power generation, transportation, end-use) Imply changes in costs, efficiency, potential.**
- ❖ **Addressing the impact of them into the basic variables: energy dependency, GHG emissions, etc.**

Conclusions:

Technological breakthroughs do not offer definitive solutions for the climate change problem. They are not likely to induce stabilization of GHG emissions unless:

- 1. Active climate-protecting policies are implemented (via economic incentives)**
- 2. These climate-protecting policies involve the major global actors**

The GEM-E3 Model: General Equilibrium Model for Energy-Economics-Environment interactions

- Developed in mid 1990s by
 - Core team: NTUA, ZEW, KUL
 - Contributors: University Toulouse, University of Strathclyde, Stockholm School of Economics, Erasme, CORE and Middlesex University
- Partly financed by DG RTD
- Complementarity with other E3 models: POLES and PRIMES
- Extensively used in energy and environmental policy assessments

GEM-E3 Characteristics

- GEM is a computable general equilibrium model: simultaneous equilibrium (optimality) in all markets (endogenously determined)
- World version: 21 regions
- EU version: 15 + outer regions
- 20 sectors: focus on energy and energy-intensive sectors
- GTAP database
- Formulated in Mixed Complementarity (zero profits, equilibrium conditions and balance constraint; complementarity conditions)
- GAMS/PATH solver
- Dynamic version: working on a 5-year basis, from 1995 to 2030

The GEM-E3 model: model overview

The model considers an economy with:

- **multiple sectors, each producing a homogeneous commodity**
 - **a single representative Firm operates in each sector**
 - minimizing cost under CRTS technology
 - deriving optimal demand for production factors (including all other commodities, labour and capital)
 - **a single representative Household**
 - maximizing utility
 - allocating revenues to consumption of commodities and savings
 - determining labour supply
 - **and a Government ensuring transfer distribution and applying policy through**
 - taxes, consumption, investments etc.
-

The GRP Study
**Greenhouse gas Reduction Pathways (GRP) in
the UN-FCCC process up to 2025**

Partners:

LEPII-EPE (coord.), RIVM-MNP, ICCS-NTUA, and CES-KUL

Study performed for DG Environment

Using the GEM-E3 Model

GRP Scenarios of interest

Two “reduction profiles”, related to the 2°C, have been defined, for the set of the 6 Kyoto gases:

- **S550e for a stabilization of concentrations at 550 ppmv CO₂e for the 6 Kyoto GHGs (corresponding to 450 ppmv for CO₂ only)**
- **S650e for a stabilization at 650 ppmv CO₂e**

Assumptions of the GEM-E3 model runs

- **Economic assessment is performed under the assumption of international emission trading schemes that allow for least-cost options to be implemented in all parts of the world**
- **Grandfathering principle for permit allocation**
- **Revenues/losses recycled in the economy (to firms and households)**
- **Perfect market for emission quotas**
- **Welfare analysis, based on utility of households derived from consumption and leisure**

Change in Welfare and Net Sales of Quotas as % of GDP (relative to the baseline)

Source : GEM-E3

Summary of GEM-E3 Results

The General Equilibrium approach allows to account for indirect macroeconomic costs, in addition to the ‘direct’ costs

- **For each region, the impacts on welfare are strongly correlated to emission trading, except for fossil fuel exporting regions, which are also affected by changes in their exports**
- **In 2025, the total cost of achieving reductions represents 0.7-0.9% of world GDP in S650e and 1.9-2.8% in S550e**

The GRP follow-up Study

IPTS

**Study performed for the post-2012 Communication
Using the POLES and GEM-E3 Models**

GRP follow-up: Three Limited Participation Scenarios

(1) “Annex I freeze”

- **EU-25 reduces emissions by 2025 to 8% below 1990 level,**
- **while all other Annex I countries continue to be restricted to the Kyoto target by 2025**
- **The US, by 2025, stabilizes absolute emissions at the 2012 level resulting from compliance with the intensity target**
- **JI and CDM, are available beyond 2012**

(2) “EU freeze”

- **EU-25 reduces emissions by 2025 to 8% below 1990 level, and no other countries take on commitments beyond 2012**
- **Two cases: whether JI and CDM are available beyond 2012**

(3) “EU reduce”

- **EU-25 reduces emissions by 2025 to 20% below 1990 level, and no other countries take on commitments beyond 2012**
 - **Two cases: whether JI and CDM are available beyond 2012**
-

Results of Limited Participation Scenarios: POLES and GEM-E3 models

	Annex I freeze	EU freeze		EU reduce	
		<i>With JI/CDM</i>	<i>Without JI/CDM</i>	<i>With JI/CDM</i>	<i>Without JI/CDM</i>
Global reduction (compared to baseline)	7.3 %	3.3 %		3.9 %	
EU reduction (compared to 1990)	8 %	8 %		20 %	
Costs for the EU in % of 2025 GDP (partial equilibrium) ¹⁾	0.023 %	0.008 %	0.020 %	0.013 %	0.036 %
Costs for the EU in % of 2025 GDP (general equilibrium) ²⁾	0.045 %	0.015 %	0.780 %	0.023 %	1.672 %

Note: 1) POLES model 2) GEM-E3 model

The Challenges Ahead

- **Depending on the risks we are willing to accept, global emissions will have to peak between 2015 and 2025...**
- **Build a broad coalition among developed and developing countries**
- **Do we need a mix of mitigation and adaptation policies?**
- **Do we need a mix of targets, timetables, technologies, and policies?**
